

DentalCare Pro

Portal Tour Feature — Build Prompts (Steps 3-5)

Step 3	Multi-Page Chain Mechanism
Step 4	Per-Page Tour Content
Step 5	Full Wiring & End-to-End Test

Prepared for implementation · Run sequentially, in order
Each step assumes the prior step's output is complete and approved

Multi-Page Chain Mechanism

Prompt

Build the confirmation-modal chaining mechanism that lets a patient continue the portal tour across multiple pages after finishing the dashboard tour. This builds on top of the refactored engine from Step 2 — do not duplicate spotlight/tooltip logic, reuse the existing PortalTour engine.

CHAIN ORDER

Dashboard -> Appointments -> Dental Records -> Book Appointment -> Profile Settings -> Support Center (final page, no further chaining)

MECHANISM

1. When a page's tour reaches its final step and the patient completes it (not skip/Escape), show a confirmation modal: "Want to see how [Next Page Name] works?" with two clear actions: "Continue Tour" and "Maybe Later" (not just an X — a clearly labeled decline button).
2. If "Continue Tour": set a sessionStorage flag (e.g. sessionStorage.setItem('dcpro_tour_chain_next', '<next-page-slug>')) and navigate to that page's URL.
3. On each page's load, check for that sessionStorage flag. If present and matches the current page, clear the flag immediately and auto-start that page's tour (no button click required) once the page's own loading state has settled.
4. If "Maybe Later" is clicked: clear any chain flag, set the permanent localStorage.dcprou_tour_completed = 'true' (the chain counts as completed onboarding even if not every page was seen), and close the modal with no navigation.
5. If the patient navigates manually (clicks a sidebar link instead of "Continue Tour"), the chain must NOT auto-continue — only an explicit "Continue Tour" click should set the sessionStorage flag. Manual navigation should silently end the chain.
6. The final page in the chain (Support Center) must show a distinct completion message instead of "Continue to next page?" — e.g. "You're all set! You've completed the portal tour." with a single "Done" button, not a Continue/Maybe Later choice.
7. Style the confirmation modal with a scale+fade entrance (start ~95% scale / opacity 0, animate to 100% / opacity 1 over ~200ms, with a backdrop fade-in), using the same easing curve and reduced-motion inheritance approach established in Step 2.

Implement this as a shared module (e.g. tour-chain.js) that any page's tour config can hook into, separate from the core PortalTour engine and separate from any individual page's step content.

Files to Upload

File	Why it's needed
portal-tour.js	The refactored engine output from Step 2 — the chain mechanism hooks into this
dashboard-tour-config.js	Step 2's output — shows how a page's tour config is structured, as a reference pattern
dashboard.php	Where the chain first triggers, after the dashboard tour's final step
sidebar.php	Source of truth for each page's URL/slug, needed to build the chain order correctly
main-layout.php	Existing easing curve and reduced-motion CSS rule, for modal animation consistency

Note: this step does not require any of the five individual page files yet (Appointments, Book Appointment, etc.) — only the mechanism is being built here. Page-specific tour content comes in Step 4.

Per-Page Tour Content

Run this prompt once per page, in chain order: Appointments → Dental Records → Book Appointment → Profile Settings → Support Center.

Prompt

Write the tour content (getSteps() config + mock data injector if needed) for [PAGE NAME].php, following the same pattern established by dashboard-tour-config.js.

- Before writing the steps:
1. Identify this page's real, stable DOM selectors for each meaningful section worth highlighting.
 2. Check this page's actual mobile/responsive layout (not assumed) — note any elements that reposition, collapse, or hide at mobile widths, since those need branching logic the same way the dashboard's sidebar step did.
 3. Determine whether this page needs mock data injection (does it have a real empty state for new patients, or does it always show real content regardless of patient history?).

Then propose the step-by-step tour plan (target, tooltip copy, mobile branch if needed) for my review before writing any code, consistent with my standing preference to approve a plan before implementation.

This page is the [Nth] page in the chain — its final step should end with the chain's "Continue to [Next Page]?" confirmation modal from tour-chain.js, unless this is the last page in the chain (Support Center), which ends with the completion message instead.

Files to Upload (per page — swap accordingly)

File	Why it's needed
[page-name].php	The actual page being toured — e.g. appointments.php, book-appointment.php, dental-records.php, profile-settings.php, or support-center.php
sidebar.php	Confirms the page's nav entry, URL, and mobile drawer/collapse behavior for any nav-related steps
main-layout.php	Shell context, sticky header, global animation/reduced-motion rules
design-config.php	Color/style tokens to keep tooltip copy and styling consistent with the rest of the site
portal-tour.js	The refactored engine — needed for reference so step targets/config match its expected shape
tour-chain.js	Step 3's output — needed so each page's final step can correctly call into the chain's "Continue?" modal

Run this five times total, once per page, in the chain order listed above. Each run should be its own conversation turn: review the proposed plan before approving implementation, consistent with your standing workflow preference.

Full Wiring & End-to-End Test

Prompt

Wire the complete tour chain end-to-end across all six pages (Dashboard, Appointments, Dental Records, Book Appointment, Profile Settings, Support Center) using tour-chain.js and each page's individual tour config built in Step 4.

Verify and fix as needed:

1. The chain flows correctly in order with no broken links between pages.
2. Skip/Escape/"Maybe Later" correctly halts the chain at any point without leaving stale sessionStorage flags.
3. Sidebar collapse state and any other temporarily-modified UI state (from any page's "Explore More"-style step) is correctly restored when leaving that page, even via the chain's auto-navigation.
4. Mobile and desktop behavior both work correctly on every page in the chain, not just the dashboard.
5. The final Support Center completion message displays correctly and the chain does not attempt to continue further.
6. Re-running the tour via any page's "Replay Tour" entry point works independently of the chain (i.e., replaying just one page's tour doesn't accidentally re-trigger the full chain unless the patient explicitly continues from that page's end-of-tour modal).

Report any inconsistencies found between pages during this end-to-end pass.

Files to Upload

File	Why it's needed
dashboard.php	First page in the chain
appointments.php	Second page in the chain
dental-records.php	Third page in the chain
book-appointment.php	Fourth page in the chain
profile-settings.php	Fifth page in the chain
support-center.php	Final page in the chain — completion message lives here
dashboard-tour-config.js + each page's tour config	All per-page step content built across Step 4's five runs
portal-tour.js	The shared engine all pages depend on
tour-chain.js	The chaining mechanism connecting every page
main-layout.php	Shared shell, animation rules, sticky header
sidebar.php	Navigation structure, collapse/mobile drawer logic
header.php	Sticky header, hamburger menu target for nav-related steps
design-config.php	Style tokens for consistency verification across all pages

This is the full integration test — essentially the entire project at this point. Upload everything together in one conversation so inconsistencies between pages can be cross-checked directly.
